

# Separate Video and Audio from News Video

- [Extracting only Audio From Video](#)

We are going to take a look at **Moviepy** module of python which is widely used for editing videos using python.

Moviepy makes video editing painless in python and by using just few python one-liners one can get desired outcome!

Here we are going to extract audio file from a sample video file.

I have used a sample MP4 video clip in this blog. You can use any video file.

It will give u audio file as output

- [Removing audio from Video \(muting the video\)](#)

One way to do this is generating all the frames of video and then combining all the frames to get a new video without audio in it.

[code implementation](#)
